The tomoterapia in a revolutionary technique in the fight against the cancer. It has great advantages: it reduces the indirect effect remarkably and it shortens the time of treatment. The Madrilenian Institute of Oncología has started up this technique, that only works in three centers in Europe. It allows to approach with x-ray tumors that until now could not be treated, to be located near vital organs or because they have reappeared after being treated. The radiations are more precise and they do not damage healthy weaves. The tomoterapia is indicated specially for tumors of lung, column, head, neck and brain.
